

PARALLEL AND DISTRIBUTED COMPUTING LAB

REPORT

NAME: S Shyam Sundaram

REG NO: 19BCE1560

PROGRAMMING ENVIRONMENT: MPI

PROBLEM: MPI

DATE: 10th November, 2021

HARDWARE CONFIGURATION:

CPU NAME	:	Intel core i5 – 1035G1 @ 1.00 Ghz
Number of Sockets:	:	1
Cores per Socket	:	4
Threads per core	:	1
L1 Cache size	:	320KB
L2 Cache size	:	2MB
L3 Cache size (Shared):	:	6MB
RAM	:	8 GB

QUESTION

Write an MPI program that finds the maximum and minimum element in a matrix using MPI_Reduce, MPI_MIN and MPI_MAX.

CODE

```
#include <mpi.h>
#include <stdio.h>
#include <stdlib.h>
#include <time.h>
```

```
const int n = 8; //must be equal to number of processes -np while running with mpirun
const int m = 5;
```

```
void createMatrix(int matrix[n][m])
{
    int c=0;
    for (int i = 0; i < n; i++)
    {
        for (int j = 0; j < m; j++)
        {
            printf("%d\t",c);
            matrix[i][j] = c++;
        }
    }
}
```

```

    }
    printf("\n");
}
}

int main(int argc, char* argv[])
{
    int id = 0;
    int comm_size = 0;

    int mat[n][m]; //the matrix created and distributed by master process
    int row[m]; //one row of matrix to be used by each process
    int colmax[m]; //will contain the maximum of each column
    int colmin[m]; //will contain the minimum of each column

    MPI_Init(&argc, &argv);

    MPI_Comm_rank(MPI_COMM_WORLD, &id);
    MPI_Comm_size(MPI_COMM_WORLD, &comm_size);

    if (id == 0)
    {
        createMatrix(mat);
        printf("Name: Shyam S\nReg num: 19BCE1560\n\n");
    }

    MPI_Scatter(mat, m, MPI_INT, row, m, MPI_INT, 0, MPI_COMM_WORLD);

    MPI_Reduce(row, colmax, m, MPI_INT, MPI_MAX, 0, MPI_COMM_WORLD); //colmax has
    maximum element of each column
    MPI_Reduce(row, colmin, m, MPI_INT, MPI_MIN, 0, MPI_COMM_WORLD); //colmin has
    minimum element of each column
    // if(id!=0)
    // {
    //     for(int i=0;i<m;++i)
    //     {
    //         printf("process %d element %d = %d\n",id,i,row[i]);
    //     }
    // }
    if (id == 0)
    {
        int max = colmax[0];
        for(int i=1;i<m;++i)
        {

```

```

        if(max<colmax[i])
            max=colmax[i];
    }
    int min = colmin[0];
    for(int i=1;i<m;++i)
    {
        if(min>colmin[i])
            min=colmin[i];
    }
    printf("Max: %d\nMin: %d\n",max,min);
}

MPI_Finalize();

return 0;
}

```

COMMANDS

mpicc matrix.c

mpirun --oversubscribe -np 8 ./a.out

OUTPUT

```

shyam@shyam-Inspiron-14-5408: ~/Academics/Lab-Fall-2021/PDC/Lab11$ mpicc minmax.c
shyam@shyam-Inspiron-14-5408: ~/Academics/Lab-Fall-2021/PDC/Lab11$ mpirun --oversubscribe -np 8 ./a.out
0      1      2
3      4      5

Max: 39
Min: 0
shyam@shyam-Inspiron-14-5408:~/Academics/Lab-Fall-2021/PDC/Lab11$
```

With $n=8$ and $m=5$

OBSERVATION

Each worker gets a row of the matrix. Then, MPI_Reduce finds the max and min in each column by comparing the elements in same index of each row belonging to different worker. We get the maximum and minimum of each column this way. Then using a function, we just loop through the maximum and minimum of each column and find the maximum and minimum among them.

CONCLUSION

We have found maximum and minimum elements of a matrix using MPI_MIN and MPI_MAX in C.
